1. This week's Problem of the Week in Math is described as follows:

There are thirty positive integers less than 100 that share a certain property. Your friend, Blake, wrote them down in the table to the left. But Blake made a mistake! One of the numbers listed is wrong and should be replaced with another. Which number is incorrect, what should it be replaced with, and why?

The numbers are listed below.

```
6
    10
         14
              15
                   21
22
    26
         33
              34
                   35
38
    39
         46
              51
                   55
57
    58
         62
              65
                   69
         82
75
    77
              85
                   86
87
    91
         93
              94
                   95
```

Use the fact that the "certain" property is that these numbers are all supposed to be the product of *unique* prime numbers to find and fix the mistake that Blake made.

 ${\bf Reminder:}\ {\bf Code}\ {\bf your}\ {\bf solution}\ {\bf in}\ {\bf an}\ {\bf R}\ {\bf script}\ {\bf and}\ {\bf copy}\ {\bf it}\ {\bf over}\ {\bf to}\ {\bf this}\ .$   ${\bf Rnw}\ {\bf file}.$ 

Hint: You may find the %in% operator and the setdiff() function to be helpful.

## Solution:
